

# Getting Started Part 2 - REST and Converters

This guide will introduce you to the new converter feature and explain how to retrieve data from a REST API.

## Prerequisites

This guide assumes you have already walked through the [general Quickstart guide](#), i.e. have Confluence up and running, PocketQuery installed and configured and you understood how datasources, queries and templates work together.

## Topics

- [Create A Basic REST Connection](#)
- [Add A Converter](#)

Start with "Create A Basic REST Connection"

## What's next?

We prepared a [number of different REST examples](#), that show how to use other types of REST connections. As always, the [User / Administrator Guide](#) is a good source of information as well.

Have fun exploring the possibilities of PocketQuery!
